PHYSICS

The plan for the next 15 minutes:

- Decisions taken:
Technology and sites
- Tests and prototypes
- Next steps
- Summary

KM3NeT

Not included:
Physics aspects &
ORCA case study

Decisions taken

Flashback end-2009 (after Design Study):

- Which architecture to use?
(strings vs. towers vs. new design)
- Design of photo-detection unit
(large vs. several small PMs, functionality, ...)
- Readout and data acquisition?
(how to implement? custom-built ASIC vs. FPGA, ...)
- Deployment technology?
(2 types of “Compactify and unfurl” vs. traditional)
- And finally: (to) site decision.

2013: All solved and decided!

KM3NeT: a distributed Research Infrastructure

- Centrally managed
- Common hardware
- Common software, data handling and operation control
- Sites in France, Greece, Italy
- Consistent with funding structure (regional sources)

KM3NeT Sites

- KM3NeT-France:
Toulon
- KM3NeT-Italy:
Capo Passero
- KM3NeT-Greece:
Pylos
- Long-term site
characterisation
measurements
performed

The building block concept

- Building block:
 - 115 detection units
 - Segmentation enforced by technical reasons
 - Sensitivity for muons independent of block size above ~ 75 strings
 - One block \sim half IceCube
- Geometry parameters optimised for galactic sources (E cut-off)
- Technical feasibility verified
- KM3NeT includes **6 building blocks**

Detection units: Strings

- Mooring line:
 - Buoy (probably syntactic foam)
 - 2 Dyneema[®] ropes (4 mm diameter)
 - 18 storeys (one OM each),
36m distance, 100m anchor-first storey
- Electro-optical backbone (VEOC):
 - Flexible hose ~ 6mm diameter
 - Oil-filled
 - fibres and copper wires
 - At each storey:
connection to 1 fibre+2 wires
 - Break out box with fuses at each storey:
One single pressure transition

OM with many small PMTs

- 31 3-inch PMTs in 17-inch glass sphere (cathode area~ $3 \times 10''$ PMTs)
 - 19 in lower, 12 in upper hemisphere
 - Suspended by plastic structure
- 31 PMT bases (total ~140 mW) (D)
- Front-end electronics (B,C)
- Al cooling shield and stem (A)
- Single penetrator
- 2mm optical gel

Advantages of the KM3NeT DOM

- Increased photocathode area
 - 1 KM3NeT DOM = 3 ANTARES OMs
 - Reduces numbers of penetrations/connectors (expensive & risky)
 - Reduces number of optical modules and their infrastructure (expensive)
- 1-vs.-2 photo-electron separation
 - Better sensitivity to coincidences / background suppression
 - Information at online data filter level
- Directionality
 - Additional input to reconstruction and veto algorithms
 - Identification of downgoing events (PMTs are also looking upwards)
 - Reduction of random background (K40, bioluminescence)

PMT availability

Hamamatsu R12199-02

ET Enterprises Ltd (ETEL, UK)
D783KFLA, D793KFLA – 78 mm

104 pc 10 pc

D792KFLA – 90 mm

12 pc

HZC (China) XP53

7 pc 76 mm

Test sites:

Hellenic University, Nikhef, LNS INFN Catania and ECAP

Deploying strings

string rolled
up for self-unfurling:

Tests and prototypes

String mechanical deployment tests

Several deployments 2-12 April 2013 at a depth of 1000m (NIOZ boat)
20 miles off the coast of Motril, Spain

- Successful demonstration of deployment concept
- DOMs are horizontal
- VEOC cable → no leaks
- Some issues with penetrators (understood)
- Second test towards end of year

The Pre-production Optical Module

- Fully equipped DOM (31 PMTs + acoustic positioning sensors + time calibration LED beacon)
- Mounted on the Instrumentation Line of ANTARES (2475m deep)
- Internal reference: “PPM-DOM”
- Deployed and connected with ROV on 16 April 2013
- PPM-DOM fully operational and working well

PPM-DOM: K40 Coincidences

Up to 150
Cherenkov
photons
per decay

e^- (β decay)

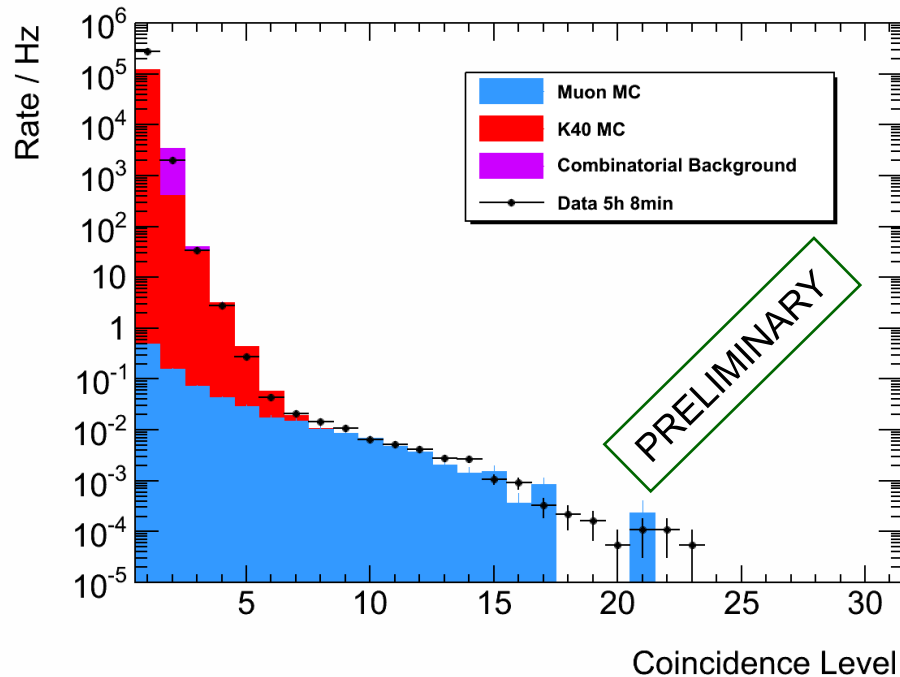

Coincidence rate on 2 adjacent PMTs

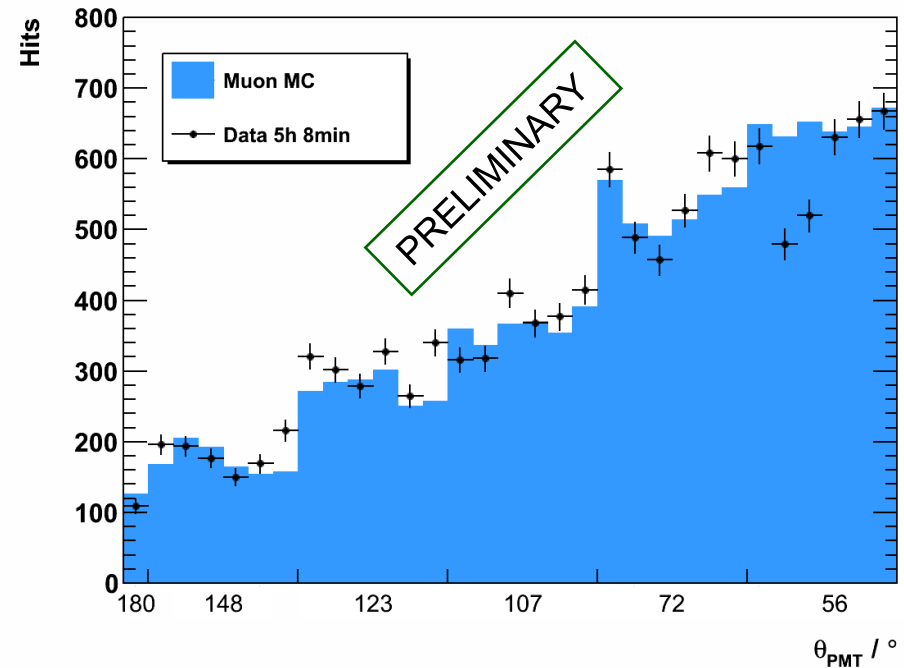

Concentration of ^{40}K is stable
(coincidence rate ~ 5 Hz on adjacent PMTs)

PPM-DOM: Atmospheric Muons

Number of coincident hits in a DOM

>5 coincidences within 20ns \Rightarrow
reduced K40 contribution,
dominated by atmospheric muons

Zenith angle of hit PMTs in events
with more than 6 coincident hits

More upper PMTs in multi-hit events \Rightarrow
directional information
from single storey

KM3NeT-Italy: site qualification

Connected by ROV
March 23, 2013

First continuous
rate measurements

Long term monitoring of site characteristics

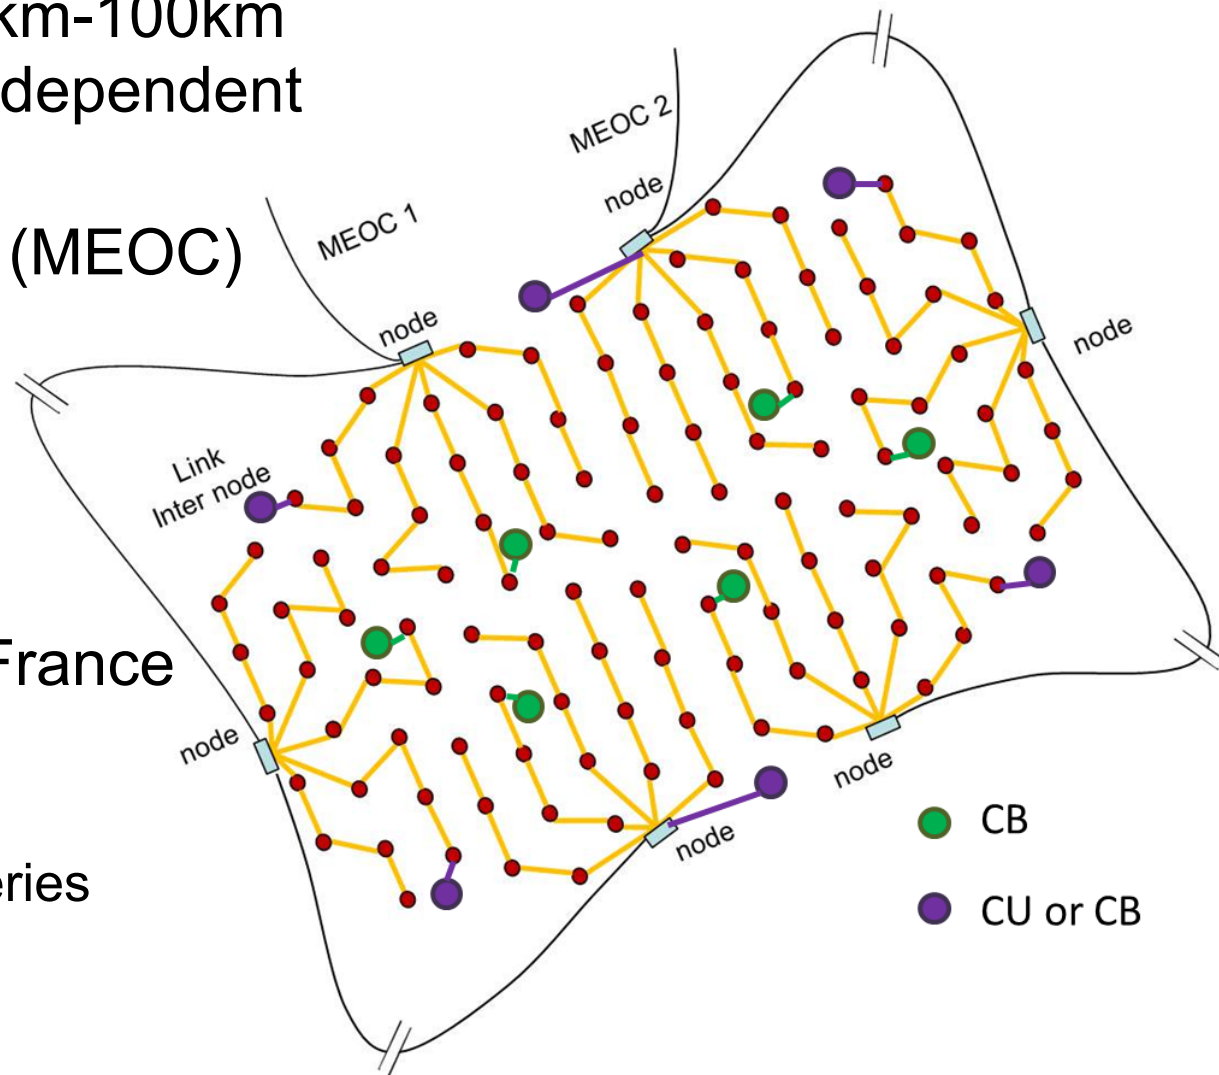

Next steps

KM3NeT Phase-1

- 40 M€ available (out of ~220 M€ estimated for full KM3NeT)
- Substantial part: European Regional Development Funds
Must be spent by end of 2014 → Use or lose!
- KM3NeT decided to embark on first construction phase
 - Transformation consortium → collaboration early 2013, management established, MoU endorsed by collaboration.
 - Construction will start at Toulon and Capo Passero sites, very tight time schedule
 - Common technology, software, data handling, operation, governance
- Goals:
 - Provide Northern-hemisphere NT with unprecedented sensitivity
 - Demonstrate feasibility, operability, stability, resolutions, sensitivity
 - Provide infrastructural environment for phase-2

Seabed infrastructure

- Shore distances: 15km-100km
→ exact design site-dependent
- Power via main electro-optical cable (MEOC)
 - short distances (intra-detector): AC;
long distances (shore-detector): DC
 - 24-36 Optical fibres
- Example: KM3NeT-France
 - 3 nodes per MEOC
 - 20 strings per node
 - sets of 4 strings in series

KM3NeT-Italy installation plans (phase-1)

- Start with 8 towers (necessary to match spending profile and to demonstrate construction activity)
- Add 24 strings until 2015
- High-level tower-string data combination

Towards KM3NeT phase-2

- KM3NeT-Greece (beyond phase-1)
 - Application pending
 - If successful: Site development and first detector construction
 - Time scale for decision and implementation unclear
- Full installation (phase-2)
 - No firm commitments yet
 - Financial construction part of phase-1 program; EU funding sources (structural funds; Horizon2020; ...)
 - ERIC planned (headquarter in Amsterdam)
- Future of neutrino astronomy will have global dimension

Summary

Summary

- KM3NeT will be a distributed, networked research infrastructure.
- Technical design is fixed and decided.
- Intense prototyping and test program ongoing; very encouraging results so far.
- First construction phase will start 2014 (KM3NeT phase-1).
- Path towards full implementation to be defined during phase-1.
- Considering global dimension for future planning will be crucial for neutrino astronomy.

Backup

What is KM3NeT ?

- Future research infrastructure in the Mediterranean Sea
- Includes cubic-kilometre scale neutrino telescope
- Exceeds Northern-hemisphere telescopes by factor ~ 50 in sensitivity
- Exceeds IceCube sensitivity by substantial factor
- Provides node for earth and marine sciences

South Pole and Mediterranean fields of view

Galactic coordinates

2π downward sensitivity assumed (true below 180° some 10 TeV)

In Mediterranean, visibility of given source can be limited to less than 24h per day

Figure courtesy A. Kappes

Sensitivity to Galactic sources

- Supernova Remnants
 - RXJ1713.7-3946 (prime example)
 - Vela X (exciting option after update of H.E.S. data)

Priority physics objective of KM3NeT

→ Talk **Paul Kooijman**

- Fermi Bubbles

→ Talk **Paolo Piattelli**

Discovery potential for Supernova remnants

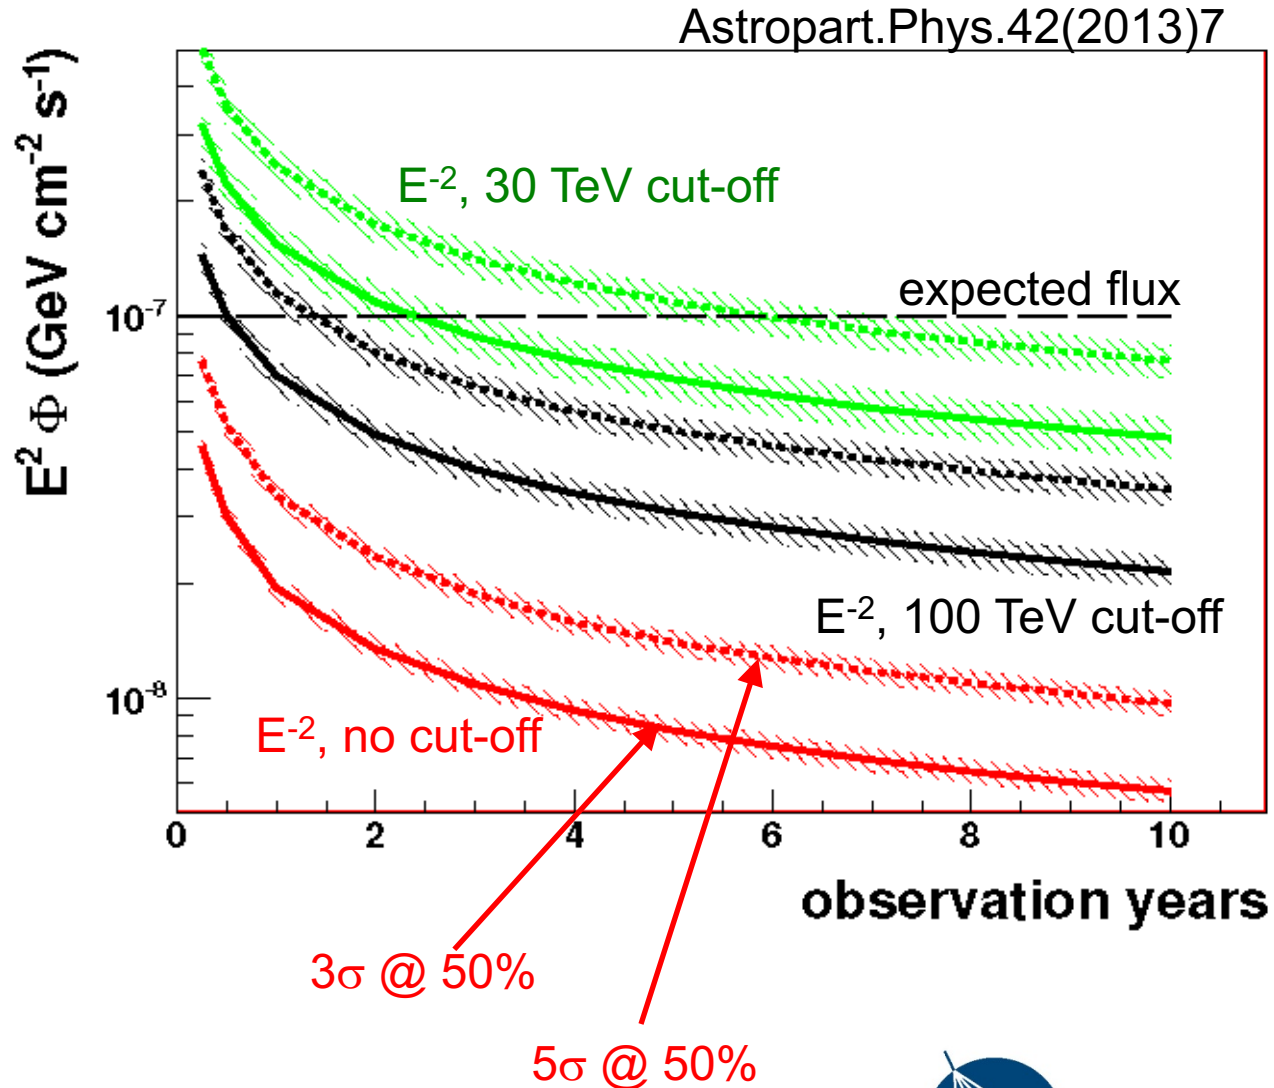

- Simulation results for 2 x 310 strings
- 5σ discovery in less than 5 years for RXJ1713.7-3946 (unbinned analysis)
- Even higher sensitivity for Vela X
- SNR neutrino fluxes (E^{-2} spectrum with cutoff) used for detector optimisation

RXJ1713 sensitivity for different string distances

The Fermi bubbles

- Two extended regions above/below centre of Galactic plane
- Fermi detected hard γ emission (E^{-2}) up to 100 GeV
- Origin and acceleration mechanisms under debate – if hadronic, hot neutrino source candidate
- Could be first source detected by KM3NeT

KM3NeT and the new IceCube results

- For Technical Design Report and design optimisation we focused on Galactic sources (μ channel, up-going)
 - Cascade reconstruction and starting track analysis not yet available.
 - In depth-studies under way (high priority).
 - No results ready for this workshop.
- Required: Assumption on the nature of the signal
 - Isotropic (?)
 - Flavour-symmetric
 - E^{-2} flux with cutoff around 2 PeV (?)
- Detector re-optimisation possible for phase-2, not for phase-1

Hydrodynamic stability

- DUs move under drag of sea current
 - Currents of up to 30cm/s observed
 - Mostly homogeneous over detector volume
 - Deviation from vertical at top about 150m at 30cm/s (can be reduced by extra buoyancy)
 - Critical current $\sim 45\text{cm/s}$ (anchor starts to move)

More on the KM3NeT digital OM (DOM)

- Light collection device
 - 20–40% gain in effective photocathode area
- Low power
 - <10 W / DOM
- FPGA readout
 - for each individual PMT
 - sub-ns time stamping
 - time over threshold
- Calibration
 - LED & acoustic piezo
- Optical fibre data transmission
 - DWDM with 80 wavelengths
 - Gb/s readout

Readout: time-over-threshold

From the analogue signal to time stamped digital data:

- Implemented for each PMT through FPGA on central logic board (CLB) contained in optical module
 - All data to shore via optical fibres
 - Time synchronisation and slow control
- see presentations by **D. Real** and **G. Kieft**

Deployment strategy

- Compact package – deployment – self-unfurling
 - Eases logistics
(in particular in case of several assembly lines)
 - Speeds up and eases deployment;
several units can be deployed in one operation
 - Self-unfurling concept being thoroughly tested and verified
- Connection to seabed network by ROV
